

Light or Dark Hair

Pigment factories in your follicles Deep within your hair follicles, specialized cells manufacture packets of pigment that they hand off to hair cells. More pigment leads to darker hair.

Julian, the combination of your genetics and other factors make you **more likely to have darker hair.**

Of 23andMe research participants with results like yours:

 **< 1%** have light blond hair.

 **2%** have dark blond hair.

 **15%** have light brown hair.

 **67%** have dark brown hair.

 **16%** have black hair.

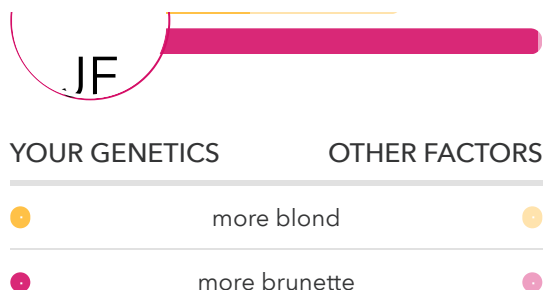

Red hair isn't included in this report because it's determined by different genetic factors. Keep reading to learn more.

How did we calculate your result?

We added up the effect of your genetic variants at 42 places in your DNA (genetic markers) plus the effect of other factors, including your age and sex.

Total effect of your genetics + other factors

Breakdown of your genetics

The bigger the circle, the stronger the effect your variants have on your overall chances.

At 11 of the genetic markers we looked at you have variants that make you likely to have lighter hair, and at 18 you have variants that make you likely to have darker hair. At 13 of the markers we looked at, you have variants with no effect either way (not shown).

More about hair color

What about red hair?

Hair color is not only determined by the amount of pigment you have, but also what kind. The lightness or darkness of your hair depends on your levels of a brown/black pigment called eumelanin. Whether you have red hair depends on your levels of a red/yellow pigment called pheomelanin. Since different genetic factors control how much of these two pigments you have, we split them into two different reports. See your Red Hair report to learn more.

Different genetic factors contribute to red hair

How hair gets its color

Hair cells don't make their own pigment. Instead, specialized skin cells called melanocytes create pigment. Inside the hair follicle, melanocytes package pigment into bundles and transfer these bundles to developing hair cells. In mid-life, a gradual loss of melanocytes may lead to gray hair.

Genetics

Some of the 42 genetic markers in this report are near genes that are thought to play a role in creating melanin, including TYR, TYRP1, OCA2, and SLC45A2. You'll see some of these genes in your Eye Color, Skin Pigmentation, and Freckles reports, too. These partly-overlapping genetics help explain why a person's skin, hair, and eyes are often (but not always) all light or all dark.

Scientific Details

We use one of two different methods to calculate your trait results.

Statistical Model

Most traits are influenced by many different factors, including genetics, lifestyle, and environment. Usually, a statistical model using many factors provides better predictions than looking at single factors by themselves. To develop our models, we first identify genetic markers associated with a trait using data from tens of thousands of 23andMe customers who have consented to research. Then, we use statistical methods to generate a "score" for that trait using your genotype at the relevant genetic markers as well as your age and sex. We predict your likelihood of having different versions of the trait based on the survey responses of 23andMe customers with similar scores. These predictions apply best to customers who are of the same ethnicity as the people whose data contributed to the model. The accuracy of these predictions varies from trait to trait.

Read more about our statistical methodology [https://permalinks.23andme.com/pdf/23-12_predictivemodel_methodology_02oct2015.pdf]

Curated Model

For some traits, just a few genetic markers can strongly predict whether a person will have a particular version of the trait. For curated models, we first evaluate published scientific studies to identify genetic markers with well-established associations with the trait. Then, we look at genetic and survey data from tens of thousands of 23andMe customers who have consented to research. We estimate your likelihood of having different versions of the trait based on survey responses from customers who are genetically similar to you at those markers. These results apply best to customers who are of the same ethnicity as the people whose data contributed to the predictions.

About your Light or Dark Hair result

Your result for this trait was calculated using a **statistical model**.

About the Light or Dark Hair model	Bin #	Black	Dark brown	Light brown	Dark blond	Light blond

Created based on customers of ethnicity: **European**

Number of customers used to create: **60,000**

Number of markers: **42**

Area Under Curve (AUC): **0.7**

Non-genetic factors: **Age, Sex**

1	0.26%	12.54%	25.43%	45.27%	16.50%
2	0.43%	16.37%	31.72%	39.67%	11.82%
3	0.72%	20.79%	33.29%	35.32%	9.89%
4	0.49%	24.32%	34.89%	33.09%	7.20%
5	0.82%	27.59%	35.38%	29.33%	6.87%
6	0.95%	31.16%	35.84%	26.81%	5.24%
7	1.18%	32.44%	37.15%	24.32%	4.91%
8	0.92%	34.70%	38.23%	21.96%	4.19%
9	1.21%	37.48%	36.50%	20.69%	4.12%
10	1.44%	39.84%	36.17%	18.85%	3.70%
11	1.51%	42.82%	35.22%	17.09%	3.37%
12	2.13%	43.96%	35.32%	16.10%	2.49%
13	2.82%	47.23%	34.08%	13.45%	2.42%
14	2.98%	50.70%	30.64%	13.06%	2.62%
15	3.57%	52.37%	32.08%	9.79%	2.19%
16	3.96%	55.24%	29.54%	9.63%	1.64%
17	5.57%	57.20%	27.77%	7.76%	1.70%
18	6.97%	61.03%	24.72%	6.22%	1.05%
19	8.68%	64.83%	20.89%	4.78%	0.82%
20	15.88%	66.99%	14.47%	2.23%	0.43%
Overall European	3.12%	40.98%	31.47%	19.77%	4.66%

Change Log

Your report may occasionally be updated based on new information. This Change Log describes updates and revisions to this report.

Date	Change
Dec. 15, 2017	Light or Dark report updated with revised content and design. Additionally, as part of regular report review and improvements in data analysis, some customers may see an updated result.
June 22, 2017	Light or Dark Hair report separated from the Hair report.
Oct. 21, 2015	Hair report created.
